

Crystals

What is a crystal?

All matter is made up of parts called atoms and molecules, if those parts are arranged in a pattern then the object is a crystal.

What creates a crystals shape?

The way a substance's atoms or molecules are joined together creates a crystal's shape.

Most matter that is not alive is made up of crystals.

When do crystals form?

Most crystals form when a liquid changes to a solid.

This can be through the evaporation of liquid or the freezing of liquid
